

ImmunoCAP® Specific IgG

Quantifying IgG antibodies with
ImmunoCAP Specific IgG

results

in improved patient evaluation

ImmunoCAP Specific IgG measures the concentration of antigen-specific IgG antibodies in human serum or plasma. The presence of antigen-specific IgG antibodies is a reliable marker of exposure to that antigen.

CLINICAL UTILITY

With ImmunoCAP Specific IgG, valuable clinical information in the fields of allergic disease and immunotherapy can be obtained.

- In allergic disease, specific IgG is used as a marker for exposure in some lung diseases including alveolitis, aspergilloma and aspergillosis
- In monitoring immunotherapy, increased levels of specific IgG indicate that the immune system is responding to therapy and that there is a general correlation with clinical outcome

ImmunoCAP Specific IgG provides a range of valuable information on allergic disease and immunotherapy.

From local clinics to the world's largest commercial laboratories, performing up to 30,000 tests per day, there is a Phadia system designed for your needs. Phadia systems offer full automation and unrivalled technology – technology that gives true quantitative IgE measurements.

A FAMILY TO GROW WITH

When your allergy testing grows you can simply add new Phadia instrumentation without having to abandon your previous system. The unique Phadia Information Data Manager software allows you to integrate several Phadia systems into one network without having to learn new software.

TECHNICAL FEATURES

- Accurate and reproducible test results
- True quantitative measurements
- Large panel of standardised, high-quality allergens and antigens available
- 40 µl serum or plasma needed per test

Phadia Laboratory Systems provide optimal allergy testing solutions using advanced, state-of-the-art technology.
